Title: TRICYCLIC BENZAZEPINE VASOPRESSIN ANTAGONISTS

This case is a continuation-in-part of Serial No. 08/373,132, filed January 17, 1995.

1. Field of the Invention

This invention relates to new tricyclic non-peptide vasopressin antagonists which are useful in treating conditions where decreased vasopressin levels are desired, such as in congestive heart failure, in disease conditions with excess renal water reabsorption and in conditions with increased vascular resistance and coronary vasoconstriction.

2. Background of the Invention

Vasopressin is released from the posterior pituitary either in response to increased plasma osmolarity detected by brain osmoreceptors or decreased blood volume and blood pressure sensed by low-pressure volume receptors and arterial baroreceptors. The hormone exerts its action through two well defined receptor subtypes: vascular V₁ and renal epithelial V₂ receptors. Vasopressin-induced antidiuresis, mediated by renal epithelial V₂ receptors, helps to maintain normal plasma osmolarity, blood volume and blood pressure.

Vasopressin is involved in some cases of congestive heart failure where peripheral resistance is

-2-

increased. V₁ antagonists may decrease systemic vascular resistance, increase cardiac output and prevent vasopressin induced coronary vasoconstriction. Thus, in conditions with vasopressin induce increases in total 5 peripheral resistance and altered local blood flow, V₁-antagonists may be therapeutic agents. V₁ antagonists may decrease blood pressure, induced hypotensive effects and thus be therapeutically useful in treatment of some types of hypertension.

10 The blockage of V₂ receptors is useful in treating diseases characterized by excess renal reabsorption of free water. Antidiuresis is regulated by the hypothalamic release of vasopressin (antidiuretic hormone) which binds to specific receptors on renal 15 collecting tubule cells. This binding stimulates adenylyl cyclase and promotes the cAMP-mediated incorporation of water pores into the luminal surface of these cells. V₂ antagonists may correct the fluid retention in congestive heart failure, liver cirrhosis, 20 nephritic syndrome, central nervous system injuries, lung disease and hyponatremia.

Elevated vasopressin levels occur in congestive heart failure which is more common in older patients with chronic heart failure. In patients with 25 hyponatremic congestive heart failure and elevated vasopressin levels, a V₂ antagonist may be beneficial in promoting free water excretion by antagonizing the action of antidiuretic hormone. On the basis of biochemical and pharmacological effects of the hormone, 30 antagonists of vasopressin are expected to be therapeutically useful in the treatment and/or prevention of hypertension, cardiac insufficiency, coronary vasospasm, cardiac ischemia, renal vasospasm, liver cirrhosis, congestive heart failure, nephritic 35 syndrome, brain edema, cerebral ischemia, cerebral

-3-

hemorrhage-stroke, thrombosis-bleeding and abnormal states of water retention.

Chem., 35, 3905(1992)] which also exhibit weak vasopressin antagonist activity in binding to V₁ and V₂ receptors. Peptide vasopressin 10 antagonists suffer from a lack of oral activity and many of these peptides are not selective antagonists since they also exhibit partial agonist activity.

Premature birth can cause infant health problems and mortality and a key mediator in the mechanism of labor is the peptide hormone oxytocin. On 35 the basis of the pharmacological action of oxytocin, antagonists of this hormone are useful in the prevention

of preterm labor, B.E. Evans et al., *J. Med. Chem.* **35**, 3919 (1992), *J. Med. Chem.*, **36**, 3993 (1993) and references therein. The compounds of this invention are antagonists of the peptide hormone oxytocin and are 5 useful in the control of premature birth.

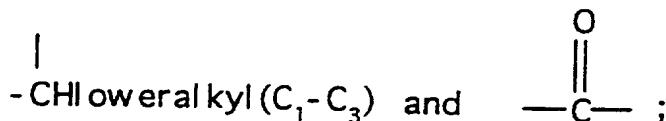

The present invention relates to novel tricyclic derivatives which exhibit antagonist activity at V₁ and/or V₂ receptors and exhibit *in vivo* vasopressin antagonist activity. The compounds also 10 exhibit antagonist activity at oxytocin receptors.

Reaction of tricyclic derivatives of Formula 6a and 6b with either a carbamoyl derivative 9 or a
 5 isocyanate derivative 10 gives compounds (Scheme 2) of formula 11a and 11b which are vasopressin antagonists of Formula I wherein R⁶ is

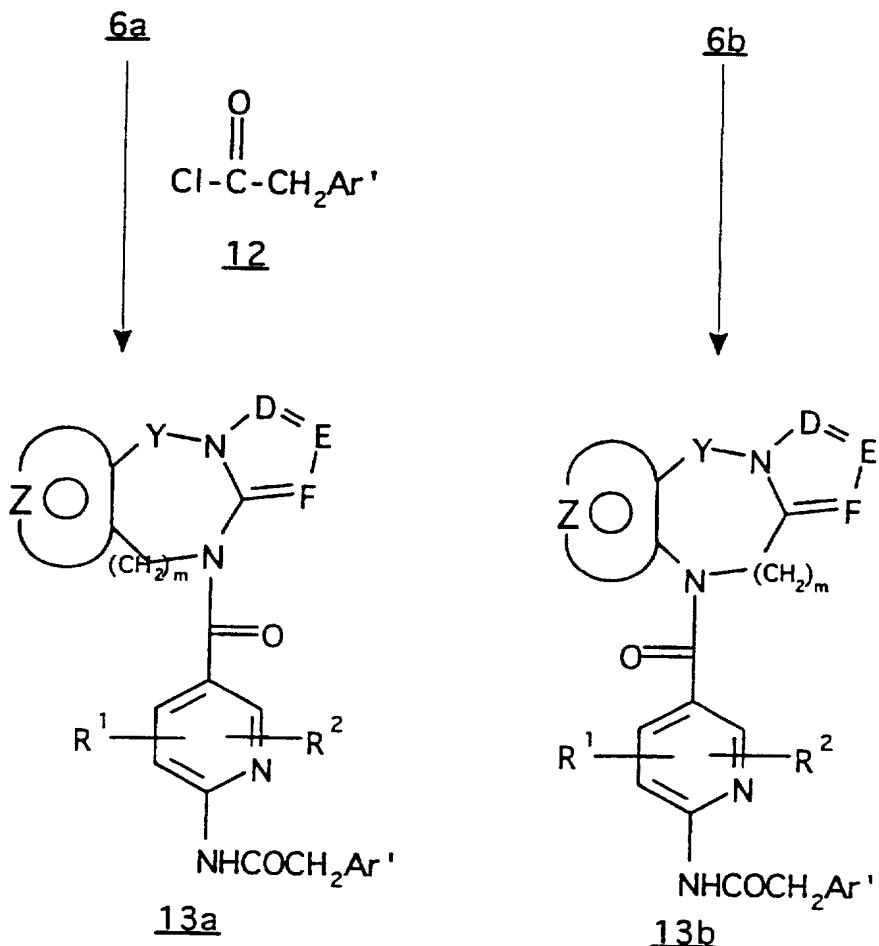

-37 -

Scheme 2

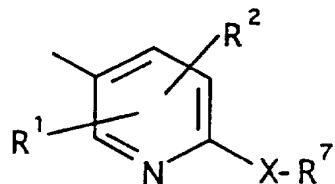

Reaction of tricyclic derivatives of Formula 6a and 6b with arylacetic acids, activated as the acid chlorides 12, anhydrides, mixed anhydrides or activated 5 with known activating reagents, gives compounds 13a and 13b (Scheme 3).

-38 -

Scheme 3

The compounds of Formula I wherein Y, A-B, Z, R¹, R² and R³ are as defined and the Ar moiety of R³ 5 (-COAr) is

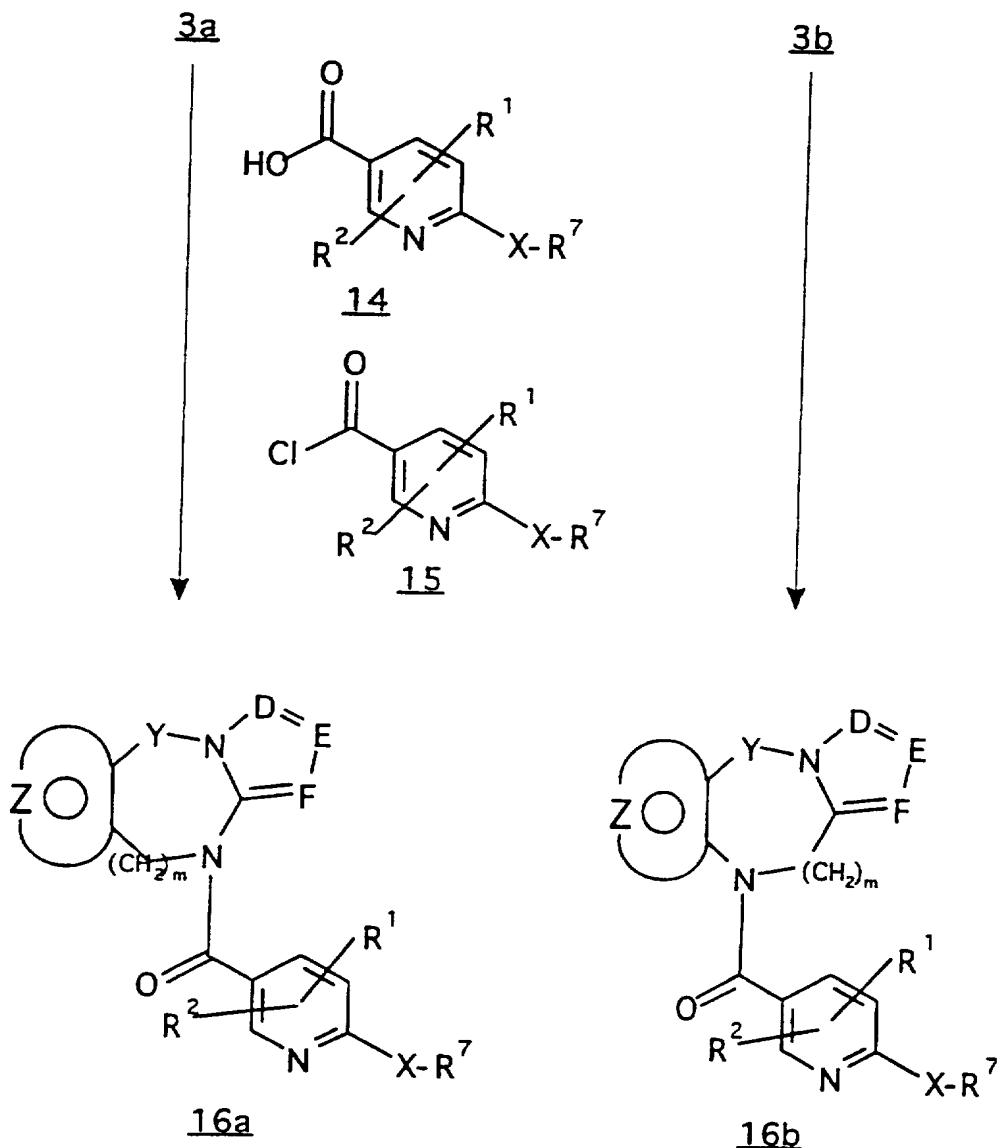

may be prepared, as shown in Scheme 4, by reacting an activated ester of the pyridine-3-carboxylic acid 14

-39 -

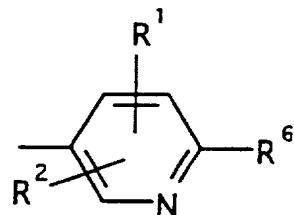

with tricyclic derivatives 3a and 3b. The pyridine-3-carboxylic acids 14 may be activated by preparing the anhydride, a mixed anhydride or reacting with diethyl cyanophosphonate, N,N-carbonyldiimidazole or related peptide coupling reagents. Alternatively, the acid chloride derivatives 15 may be prepared from the acid derivatives 14 and oxalyl chloride or thionyl chloride in an inert solvent. The solvent is removed and the derivative reacted with 3a or 3b at 0°C to 25°C in dichloromethane as solvent and a tertiary amine such as triethylamine as a base. The activating reagent for the pyridine-3-carboxylic acids 14 is chosen on the basis of its compatibility with other substituent groups and the reactivity of the activated derivative toward the tricyclic derivatives 3a and 3b to give the vasopressin antagonists 16a and 16b.

Alternatively, the compounds of Formula I wherein Y, A-B, Z, R¹, R² and R³ are as defined and the Ar moiety of R³ (-COAr) is

-41 -

wherein R^6 is the moiety

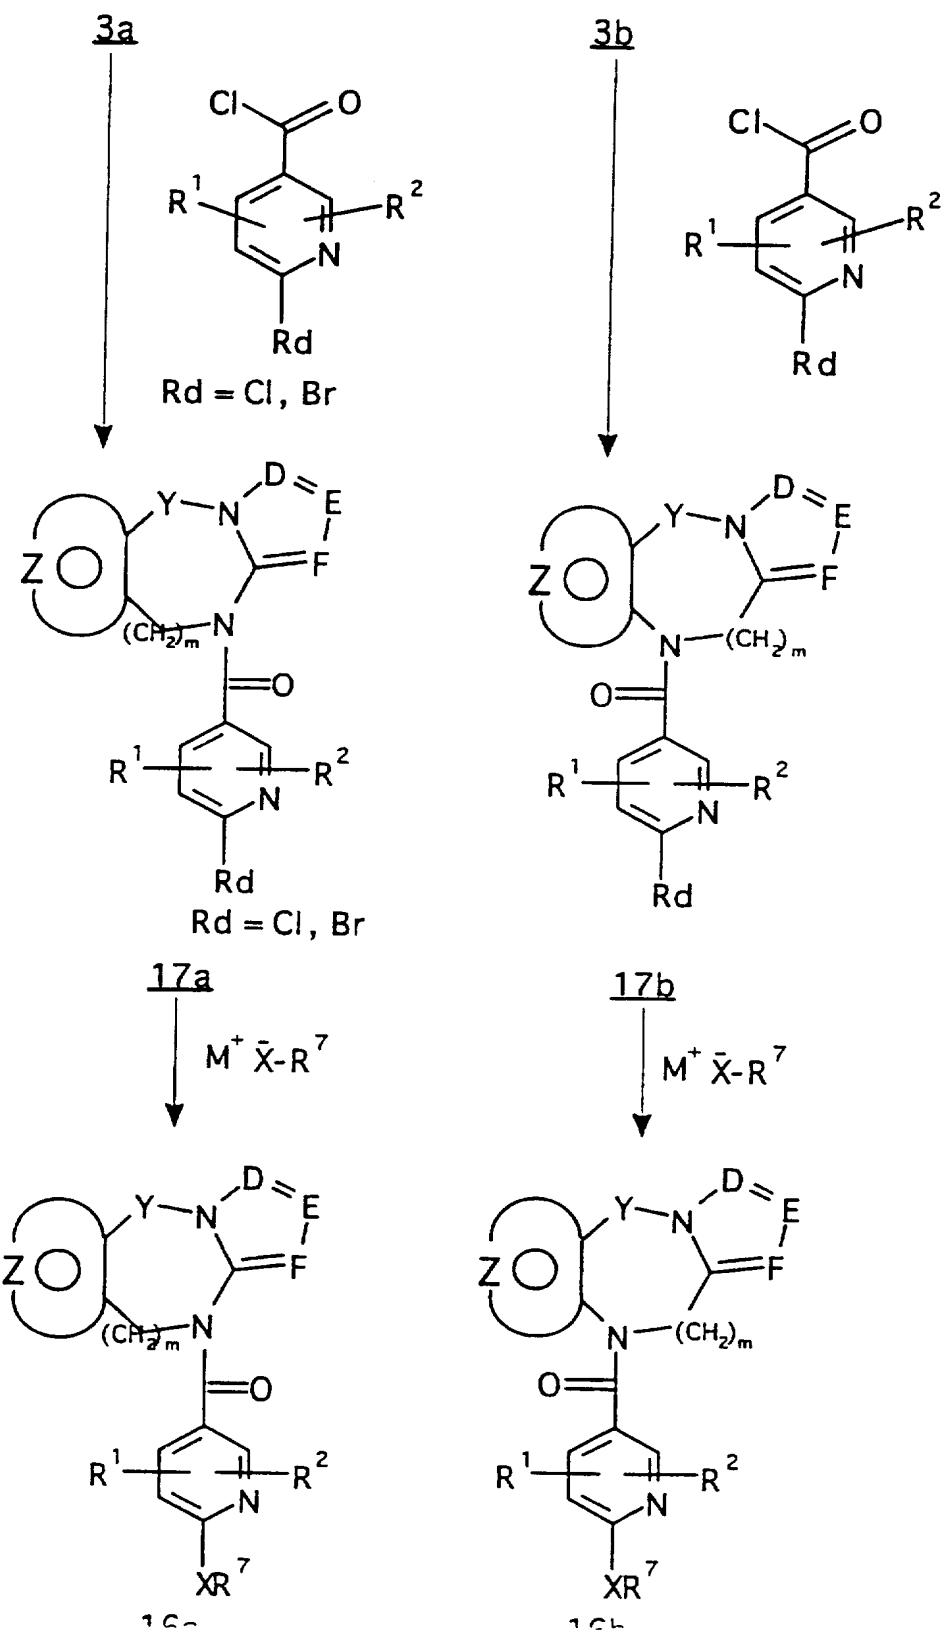

$-X-R^7$ and X is S , NH , NCH_3

may be prepared as shown in Scheme 5 by first converting
 5 tricyclic derivatives 3a and 3b into the intermediates
17a and 17b and then reacting these intermediates with
 potassium, sodium, or lithium anions (R^7-X^-) to give the
 products 16a and 16b. The symbol M^+ is a metal cation
 derived from reacting a compound HXR^7 with a metal
 10 hydride (sodium or potassium hydride, for example) or
 LDA, n-butyl lithium, lithium bis(trimethylsilyl)amide
 and the like.

The reaction of intermediates 17a and 17b with
 the moieties R^7-NH_2 and R^7-NHCH_3 may also be carried
 15 without first forming the corresponding anions. Thus,
 heating intermediates 17a and 17b with excess R^7-NH_2 or
 R^7-NHCH_3 in an inert solvent or without solvent gives
 the products 16a and 16b wherein X is NH or NCH_3 .

-42-

Scheme 5

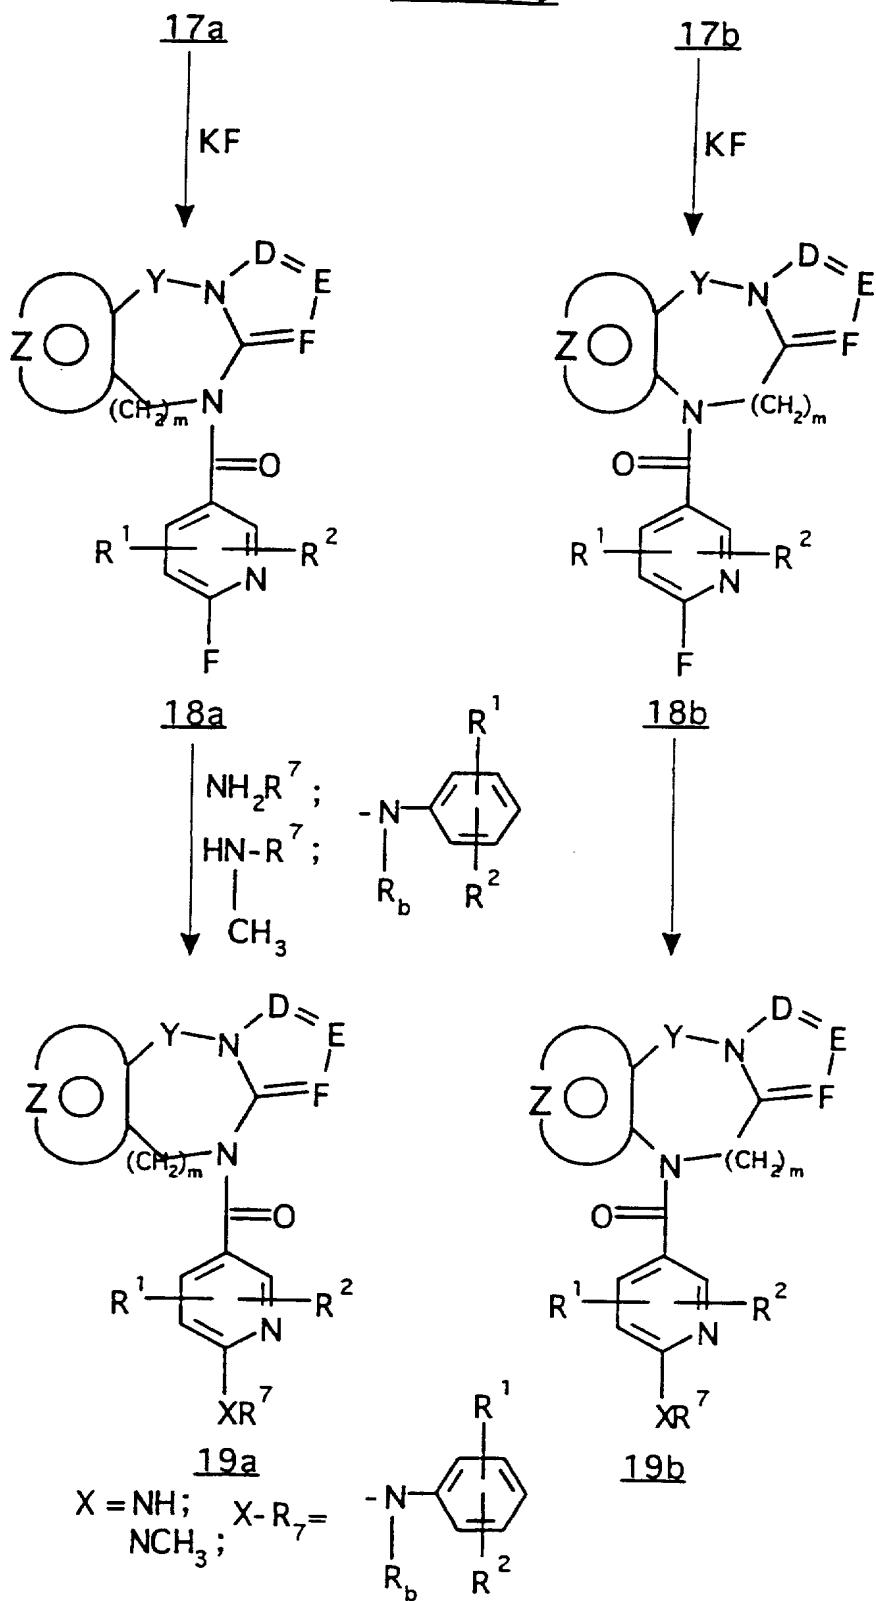

-43 -

Alternatively, the intermediates 17a and 17b may be converted to the more reactive fluoride derivatives 18a and 18b as shown in Scheme 6. Reaction of the fluoride intermediates 18a and 18b with amines NH_2R^7 and CH_3NHR^7 gives the 6-aminonicotinoyl derivatives 19a and 19b.

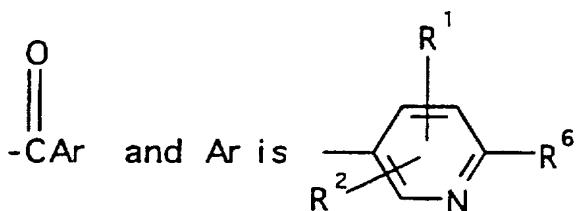

-44 -

Scheme 6

-45-

As an alternative method for synthesis of compounds of this invention as depicted in Formula I wherein Y, A-B, D, E, F and Z are as previously 5 described and R³ is

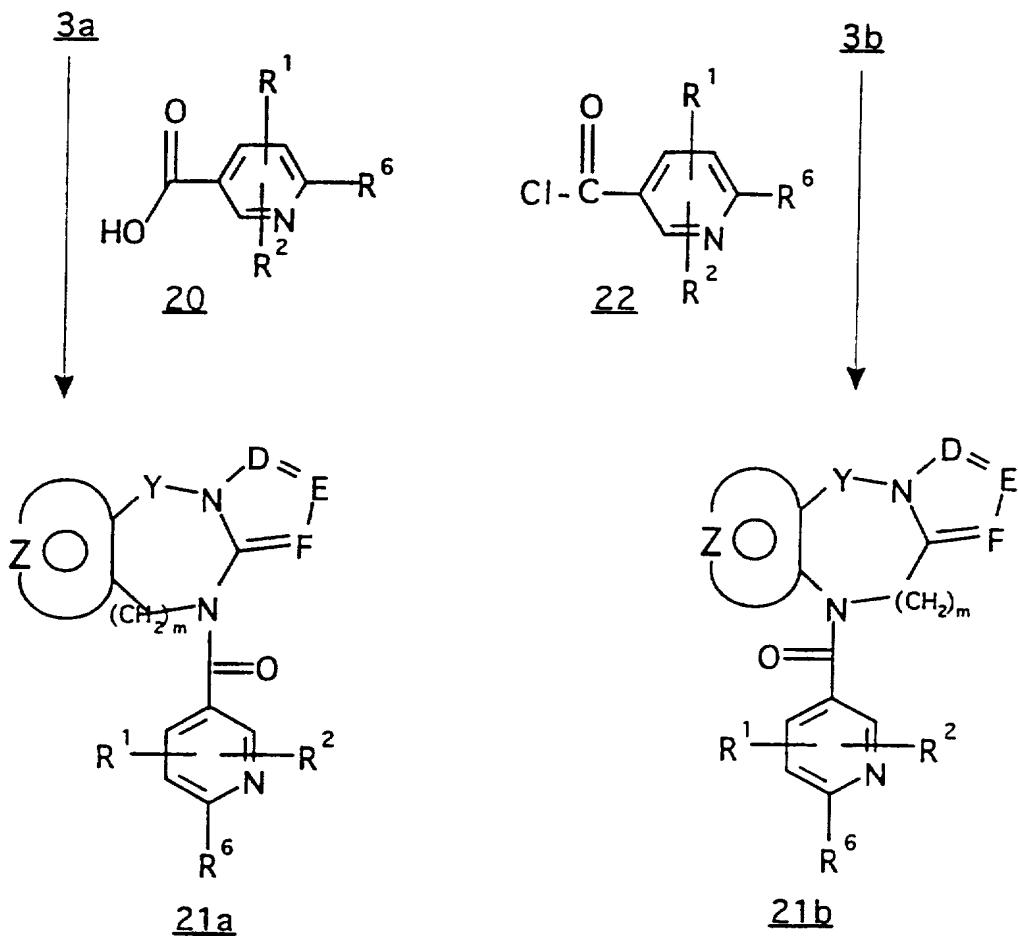

is the coupling of pyridinyl carboxylic acids 20 with the tricyclic derivatives 3a and 3b to give 21a and 21b.

The pyridine carboxylic acids are activated 10 for coupling by conversion to an acid chloride, bromide or anhydride or by first reacting with an activating reagent such as N,N-dicyclocarbodiimide, diethyl cyanophosphonate and related "peptide type" activating reagents. The method of activating the acids 20 for 15 coupling to the tricyclic derivatives 3a and 3b is chosen on the basis of compatibility with other substituent groups in the molecule. The method of choice is the conversion of the 3-pyridinyl carboxylic acids 20 to the corresponding 3-pyridinylcarbonyl 20 chlorides. The 3-pyridinylcarbonyl chlorides 22 may be prepared by standard procedures known in the art, such as reaction with thionyl chloride, oxalyl chloride and the like. The coupling reaction is carried out in solvents such as halogenated hydrocarbons, toluene, 25 xylene, tetrahydrofuran, or dioxane in the presence of pyridine or tertiary bases such as triethylamine and the like (Scheme 7). Alternatively, the 3-pyridinylcarbonyl chlorides 22, prepared from the carboxylic acids 20, may be reacted with derivatives 3a and 3b in 30 pyridine with or without 4-(dimethylamino)pyridine.

-46-

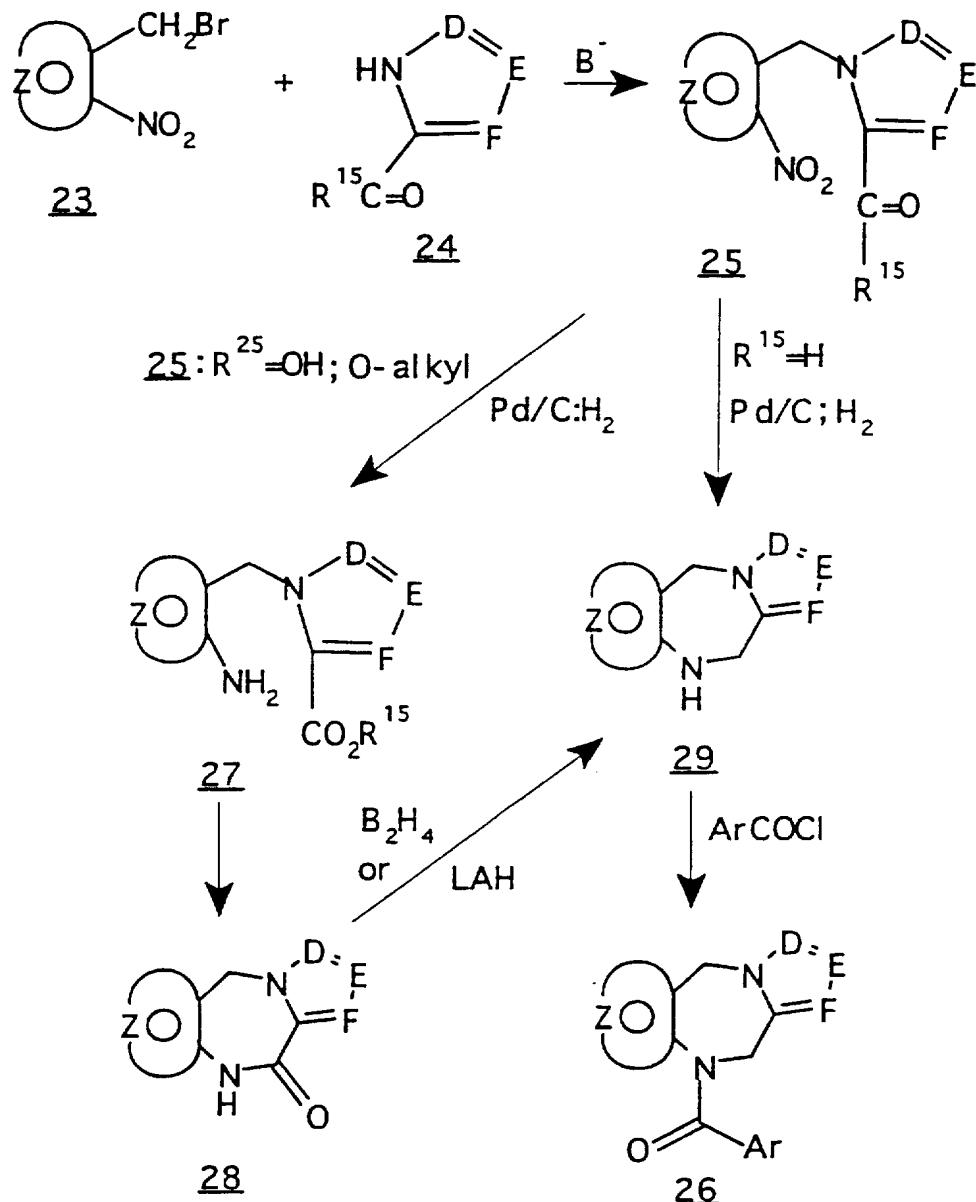

In general, when the 3-pyridinyl carboxylic acids 20 are activated with "peptide type" activating reagents, higher temperatures are required than when the 3-pyridinylcarbonyl chlorides are used.

Scheme 7

-47 -

Scheme 8

The starting materials 3a and 3b in the foregoing Schemes 1-7 may be prepared as follows. In accordance with Scheme 8, alkylation of heterocycles of structural type 24 with an alkylating moiety such as 23 gives intermediates 25. The heterocycle 24 may contain an α -

-48 -

carboxaldehyde function or an α -carboxylic and/or ester function as shown in Scheme 8. Where the intermediate 25 ($R^{15}=H$) contains an α -carboxaldehyde group, 5 hydrogenation with palladium-on-carbon gives reduction and ring closure in one step to give 29.

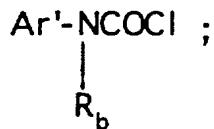

In derivatives 25 where R^{15} is an α -carboxylic and/or an α -carboxylic ester function, the intermediate amino acid derivative 27 is first isolated and then ring closed. The ring closure of derivatives 27 may be 10 carried out by heating or by activation of the acid function (27: $R^{15}=H$) for ring closure. The cyclic lactams 28 are conveniently reduced with diborane or lithium aluminum hydride to give intermediates 29. Reaction of tricyclic derivatives 29 with aroyl 15 chlorides ($ArCOCl$), where Ar is as hereinbefore defined, gives diazepines 26.

Tricyclic derivatives of structural type 36 may be prepared as shown in Scheme 9. Formylation of 32 under known conditions in the literature, such as 20 Vilsmeier formylation, gives intermediates 35 which on reduction and ring closure affords tricyclics 37.

Where the ring containing the symbol Z is a substituted or unsubstituted phenyl group, the procedure gives 4,5-dihydropyrrolo[1,2-a]-quinoxalines 36. These 25 derivatives 36 and 37 may be reacted with aroyl chlorides ($ArCOCl$) wherein Ar is as previously defined or with a substituted or unsubstituted 6-nitropyridine-3-carbonyl chloride or with a nitrogen protecting group, such as benzyloxycarbonyl chloride to give compounds 38 30 and 39. The compounds 38 and 39 may be reacted with chlorine, bromine or halogenating reagents such as N -chlorosuccinimide, N -bromosuccinimide and the like to give compounds 40 and 41 wherein R^{17} is a halogen atom. The derivatives 38 and 39 may be formylated and 35 acetylated to give products 40 and 41 wherein R^{17} is a

-49 -

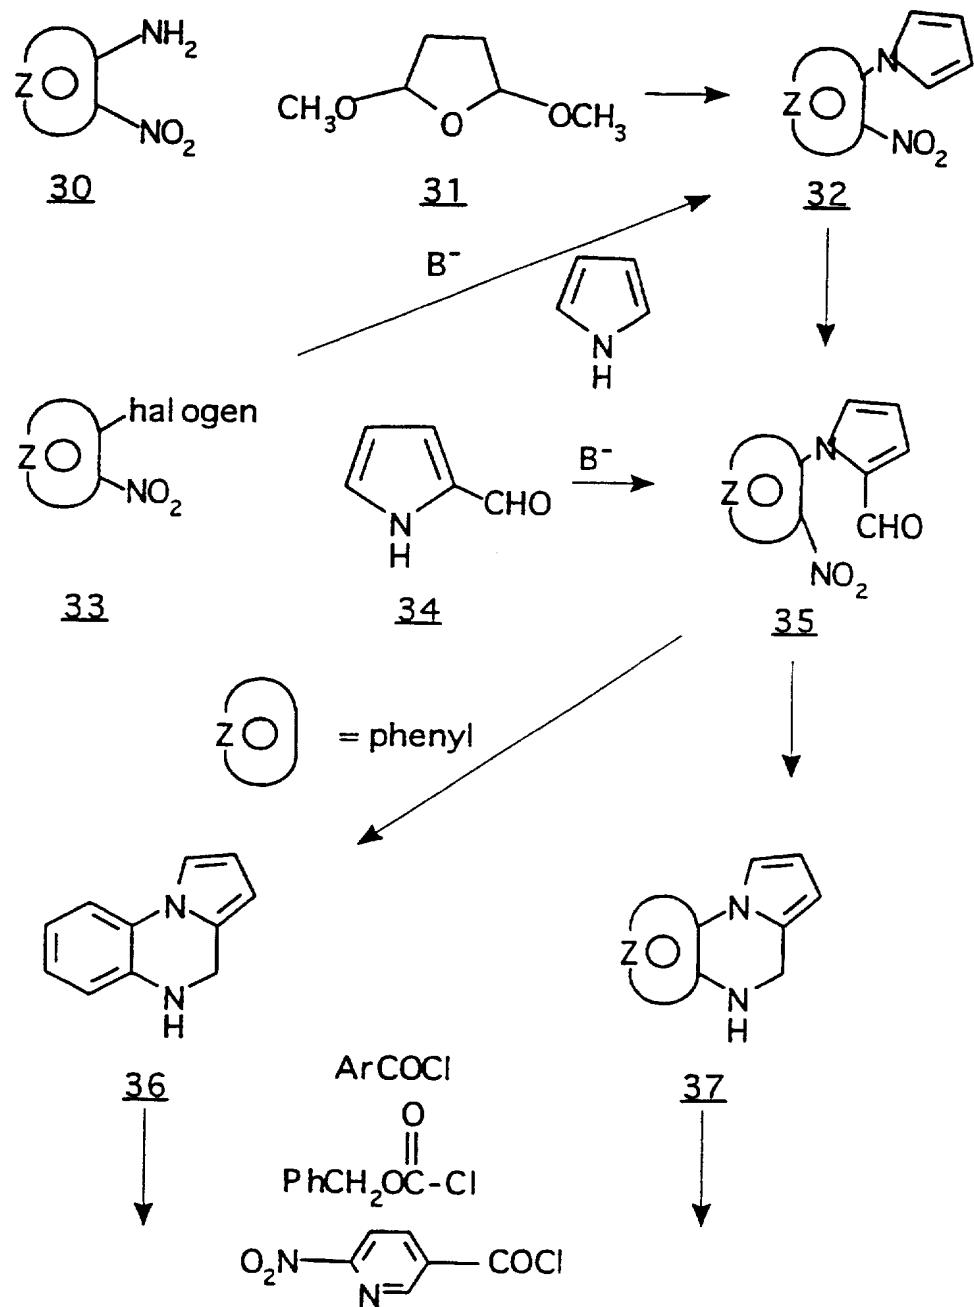

CHO or a -COCH₃ group. Halogenation, formylation and acetylation of derivatives 36 gives 1-substituted 4,5-dihydropyrrolo[1,2-a]quinoxalines. The derivatives 38, 39, 40 and 41 wherein R¹⁶ is a substituted or unsubstituted 6-nitro-3-pyridinylcarbonyl group are reduced to give the 6-amino-3-pyridinylcarbonyl derivatives 42d and 43d which are reacted with reagents Ar'COCl, Ar'CH₂COCl or

wherein Ar' and R_b are as previously hereinbefore defined, to give tricyclic diazepines 44 and 45.

For binding experiments, the following is added to the wells of a ninety-six well format microtiter plate: 100 μ l of 100.0 mM Tris.HCl buffer containing 10.0 mM MgCl₂, 0.2% heat inactivated BSA and a mixture of protease inhibitors: leupeptin, 1.0 mg %; aprotinin, 1.0 mg %; 1,10-phenanthroline, 2.0 mg %; trypsin inhibitor, 10.0 mg % and 0.1 mM PMSF, 20.0 μ l of [phenylalanyl-3,4,5,-³H] vasopressin (S.A. 45.1 Ci/mmol) at 0.8 nM, and the reaction initiated by the addition of 80 μ l of tissue membranes containing 20 μ g of tissue protein. The plates are kept undisturbed on the bench top at room temperature for 120 min. to reach equilibrium. Non-specific samples are assayed in the presence of 0.1 μ M of the unlabeled antagonist phenylalanylvasopressin, added in 20.0 μ l volume. For test compounds, these are solubilized in 50% dimethylsulfoxide (DMSO) and added in 20.0 μ l volume to a final incubation volume of 200 μ l. Upon completion of binding, the content of each well is filtered off, using a Brandel® cell Harvester (Gaithersburg, MD). The radioactivity trapped on the filter disk by the ligand-receptor complex is assessed by liquid scintillation counting in a Packard LS Counter, with an efficiency of 65% for tritium. The data are analyzed for IC₅₀ values by the LUNDON-2 program for competition (LUNDON SOFTWARE, OH).

Binding Assay to Rat Kidney Medullary V₂ Receptors

Medullary tissues from rat kidneys are dissected out, cut into small pieces and soaked in a 0.154 mM sodium chloride solution containing 1.0 mM EDTA with many changes of the liquid phase, until the solution is clear of blood. The tissue is homogenized in a 0.25 M sucrose solution containing 1.0 mM EDTA and 0.1 mM PMSF using a Potter-Elvehjem homogenizer with a teflon pestle. The homogenate is filtered through several layers (4 layers) of cheese cloth. The filtrate is rehomogenized using a dounce homogenizer, with a tight fitting pestle. The final homogenate is centrifuged at 1500 x g for 15 min. The nuclear pellet is discarded and the supernatant fluid recentrifuged at 40,000 x g for 30 min. The resulting pellet formed contains a dark inner part with the exterior, slightly pink. The pink outer part is suspended in a small amount of 50.0 mM Tris.HCl buffer, pH 7.4. The protein content is determined by the Lowry's method (Lowry et al, J. Biol. Chem., 1953). The membrane suspension is stored at -70°C, in 50.0 mM Tris.HCl, containing 0.2% inactivated BSA and 0.1 mM PMSF in aliquots of 1.0 ml containing 10.0 mg protein per ml of suspension until use in subsequent binding experiments.

For binding experiments, the following is added in μ l volume to wells of a 96 well format of a microtiter plate: 100.0 μ l of 100.0 mM Tris.HCl buffer containing 0.2% heat inactivated BSA, 10.0 mM MgCl₂ and a mixture of protease inhibitors: leupeptin, 1.0 mg %; aprotinin, 1.0 mg %; 1,10-phenanthroline, 2.0 mg %; trypsin inhibitor, 10.0 mg % and 0.1 mM PMSF, 20.0 μ l of [³H] Arginine⁸, vasopressin (S.A. 75.0 Ci/mmol) at 0.8 nM and the reaction initiated by the addition of 80.0 μ l of tissue membranes (200.0 μ g tissue protein). The plates are left undisturbed on the bench top for 120 min. to reach equilibrium. Non-specific binding is

assessed in the presence of 1.0 μ M of unlabeled ligand, added in 20 μ l volume. For test compounds, these are solubilized in 50% dimethylsulfoxide (DMSO) and added in 20.0 μ l volume to a final incubation volume of 200 μ l. Upon completion of binding, the content of each well is filtered off, using a Brandel® cell Harvester (Gaithersburg, MD). The results of this test on representative compounds of this invention are shown in Tables 1, 2 and 3.

Radioligand Binding Experiments with Human Platelet Membranes

Platelet Source: Hudson Valley Blood Services, Westchester Medical Center, Valhalla, NY.

Platelet Membrane Preparation:

Frozen platelet rich plasma (PRP), received from the Hudson Valley Blood Services, are thawed to room temperature. The tubes containing the PRP are centrifuged at 16,000 \times g for 10 min. at 4°C and the supernatant fluid discarded. The platelets resuspended in an equal volume of 50.0 mM Tris.HCl, pH 7.5 containing 120 mM NaCl and 20.0 mM EDTA. The suspension is recentrifuged at 16,000 \times g for 10 min. This washing step is repeated one more time. The wash discarded and the lysed pellets homogenized in low ionic strength buffer of Tris.HCl, 5.0 mM, pH 7.5 containing 5.0 mM EDTA. The homogenate is centrifuged at 39,000 \times g for 10 min. The resulting pellet is resuspended in Tris.HCl buffer, 70.0 mM, pH 7.5 and recentrifuged at 39,000 \times g for 10 min. The final pellet is resuspended in 50.0 mM

-172 -

Tris.HCl buffer pH 7.4 containing 120 mM NaCl and 5.0 mM KCl to give 1.0-2.0 mg protein per ml of suspension.

Binding to Vasopressin V₁ receptor subtype in Human Platelet Membranes:

In wells of 96 well format microtiter plate, add 100 μ l of 50.0 mM Tris.HCl buffer containing 0.2% BSA and a mixture of protease inhibitors (aprotinin, leupeptin etc.). Then add 20 μ l of [³H]Ligand (Manning or Arg⁸Vasopressin), to give final concentrations ranging from 0.01 to 10.0 nM. Initiate the binding by adding 80.0 μ l of platelet suspension (approx. 100 μ g protein). Mix all reagents by pipetting the mixture up and down a few times. Non specific binding is measured in the presence of 1.0 μ M of unlabeled ligand (Manning or Arg⁸Vasopressin). Let the mixture stand undisturbed at room temperature for ninety (90) min. Upon this time, rapidly filter off the incubate under vacuum suction over GF/B filters, using a Brandel® Harvester. Determine the radioactivity caught on the filter disks by the addition of liquid scintillant and counting in a liquid scintillator.

Binding to Membranes of Mouse Fibroblast Cell Line (LV-2) Transfected with the cDNA Expressing the Human V₂ Vasopressin Receptor

Membrane Preparation

Flasks of 175 ml capacity, containing attached cells grown to confluence, are cleared of culture medium by aspiration. The flasks containing the attached cells are rinsed with 2x5 ml of phosphate buffered saline (PBS) and the liquid aspirated off each time. Finally, 5 ml of an enzyme free dissociation Hank's based solution (Specialty Media, Inc., Lafayette, NJ) is added and the flasks are left undisturbed for 2 min. The content of all flasks is poured into a centrifuge tube and the cells pelleted at 300 x g for 15 min. The Hank's based solution is aspirated off and the cells

-173 -

homogenized with a polytron at setting #6 for 10 sec in 10.0 mM Tris.HCl buffer, pH 7.4 containing 0.25 M sucrose and 1.0 mM EDTA. The homogenate is centrifuged at 1500 x g for 10 min to remove ghost membranes. The supernatant fluid is centrifuged at 100,000 x g for 60 min to pellet the receptor protein. Upon completion, the pellet is resuspended in a small volume of 50.0 mM Tris.HCl buffer, pH 7.4. The protein content is determined by the Lowry method and the receptor membranes are suspended in 50.0 mM Tris.HCl buffer containing 0.1 mM phenylmethylsulfonylfluoride (PMSF) and 0.2% bovine serum albumin (BSA) to give 2.5 mg receptor protein per ml of suspension.

Receptor Binding

For binding experiments, the following is added in μ l volume to wells of a 96 well format of a microtiter plate: 100.0 μ l of 100.0 mM Tris.HCl buffer containing 0.2% heat inactivated BSA, 10.0 mM MgCl₂ and a mixture of protease inhibitors: leupeptin, 1.0 mg %; aprotinin, 1.0 mg %; 1,10-phenanthroline, 2.0 mg %; trypsin inhibitor, 10.0 mg % and 0.1 mM PMSF, 20.0 μ l of [³H] Arginine⁸, vasopressin (S.A. 75.0 Ci/mmole) at 0.8 nM and the reaction initiated by the addition of 80.0 μ l of tissue membranes (200.0 μ g tissue protein). The plates are left undisturbed on the bench top for 120 min to reach equilibrium. Non specific binding is assessed in the presence of 1.0 μ M of unlabeled ligand, added in 20 μ l volume. Oxytocin Receptor Binding

(a) Membrane Preparation

Female Sprague-Dawley rats weighing approximately 200-250 g are injected intramuscularly (i.m.) with 0.3 mg/kg of body weight of diethylstilbestrol (DES). The rats are sacrificed 18 hours later under pentobarbital anesthesia. The uteri are dissected out, cleaned of fat and connective tissues and rinsed in 50 ml of normal saline. The tissue pooled from six rats is homogenized in 50 ml of 0.01 mM Tris.HCl, containing 0.5 mM dithiothreitol and 1.0 mM EDTA, adjusted to pH 7.4, using a polytron at setting 6 with three passes of 10 sec each. The homogenate is passed through two (2) layers of cheesecloth and the filtrate centrifuged at 1000 x g for 10 min. The clear supernatant is removed and recentrifuged at 165,000 x g for 30 min. The resulting pellet containing the oxytocin receptors is resuspended in 50.0 mM Tris.HCl containing 5.0 mM MgCl₂ at pH 7.4, to give a protein concentration of 2.5 mg/ml of tissue suspension. This preparation is used in subsequent binding assays with [³H]Oxytocin.

(b) Radioligand Binding

Binding of 3,5-[³H]Oxytocin ([³H]OT) to its receptors is done in microtiter plates using [³H]OT, at various concentrations, in an assay buffer of 50.0 mM Tris.HCl, pH 7.4 and containing 5.0 mM MgCl₂, and a mixture of protease inhibitors: BSA, 0.1 mg; aprotinin, 1.0 mg; 1,10-phenanthroline, 2.0 mg; trypsin, 10.0 mg; and PMSF, 0.3 mg per 100 ml of buffer solution. Non-specific binding is determined in the presence of 1.0 uM unlabeled OT. The binding reaction is terminated after 60 min., at 22°C, by rapid filtration through glass fiber filters using a Brandel® cell harvester (Biomedical Research and Development Laboratories, Inc.,

Gaithersburg, MD). Competition experiments are conducted at equilibrium using 1.0 nM [³H]OT and varying the concentration of the displacing agents. The concentrations of agent displacing 50% of [³H]OT at its sites (IC₅₀) are calculated by a computer assisted LUNDON-2 program (LUNDON SOFTWARE INC., Ohio, USA).

The results of this assay on representative examples are shown in Table 4.

When the compounds are employed for the above utility, they may be combined with one or more pharmaceutically acceptable carriers, for example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solution or suspension containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 0.05 up to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from about 0.5 to about 500 mg/kg of animal body weight, preferably given in divided doses two to four times a day, or in sustained release form. For most large mammals the total daily dosage is from about 1 to 100 mg, preferably from about 2 to 80 mg. Dosage forms suitable for internal use comprise from about 0.5 to 500

-176 -

mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

These active compounds may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

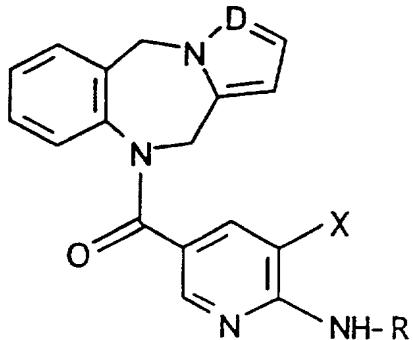

These active compounds may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparation contain a preservative to prevent the growth of microorganisms.

-177 -

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils.

Effects on the Antagonism of Endogenous Arginine Vasopressin Antidiuretic (V₂) Response in Conscious Rats with Free Access to Water Drinking Before but not During the Experiment:

Male or female normotensive Sprague-Dawley rats (Charles River Laboratories, Inc., Kingston, NY) of 400-450 g body weight were supplied with Laboratory Rodent Feed #5001 (PMI Feeds, Inc., Richmond, IN) and water ad libitum. On the day of test, rats were placed individually into metabolic cages equipped with stainless steel screens (to separate the feces from the urine) and funnels for collection of urine. Vehicle or reference agent was given at various oral doses. During the test,

-191 -

rats were not provided with water or food. Urine was collected for four hours after dosing of the test compound. At the end of four hours, urine volume was measured. Urinary osmolality was determined using a 5 Fiske One-Ten Osmometer (Fiske Associates, Norwood, MA 02062) or an Advanced CRYOMATIC Osmometer, Model 3C2 (Advanced Instruments, Norwood, MA). Determinations of Na⁺, K⁺ and Cl⁻ ion were carried out using ion specific electrodes in a Beckman SYNCHRON EL-ISE Electrolyte 10 System analyzer. In the following results, increased urine volume and decreased osmolality relative to AVP-control indicates activity. The results of this test on representative compounds of this invention are shown in Table 5.

The compounds of the present invention can be used in the form of salts derived from pharmaceutically or physiologically acceptable acids or bases. These salts include, but are not limited to, the following:

5 salts with inorganic acids such as hydrochloric acid, sulfuric acid, nitric acid, phosphoric acid and, as the case may be, such organic acids as acetic acid, oxalic acid, succinic acid, and maleic acid. Other salts include salts with alkali metals or alkaline earth

10 metals, such as sodium, potassium, calcium or magnesium or with organic bases. The compounds can also be used in the form of esters, carbamates and other conventional "pro-drug" forms, which, when administered in such form, convert to the active moiety in vivo.

15 When the compounds are employed for the above utilities, they may be combined with one or more pharmaceutically acceptable carriers, for example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible

20 powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form

25 of sterile injectable solutions or suspensions containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 25 to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

30 The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from

about 0.5 to about 500 mg/kg of animal body weight, preferably given in divided doses two to four times a day, or in a sustained release form. For most large mammals the total daily dosage is from about 1 to 100 5 mg, preferably from about 2 to 80 mg. Dosage forms suitable for internal use comprise from about 0.5 to 500 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the 10 optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

These active compounds may be administered 15 orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration 30 are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

These active compounds may also be administered parenterally or intraperitoneally. Solutions or 35 suspensions of these active compounds as a free base or pharmacologically acceptable salt can be prepared in

water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid, polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage 5 and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous 10 preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under conditions of manufacture and storage and must be preserved against the contaminating 15 action of microorganisms such as bacterial and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oil.

20 The new tricyclic non-peptide vasopressin antagonists of this invention are useful in treating conditions where decreased vasopressin levels are desired, such as in congestive heart failure, in disease conditions with excess renal water reabsorption and in 25 conditions with increased vascular resistance and coronary vasoconstriction.

In particular, the vasopressin antagonists of this invention are therapeutically useful in the treatment and/or prevention of hypertension, cardiac 30 insufficiency, coronary vasospasm, cardiac ischemia, renal vasospasm, liver cirrhosis, congestive heart failure, nephritic syndrome, brain edema, cerebral ischemia, cerebral hemorrhage-stroke, thrombosis-bleeding and abnormal states of water retention.

35 In particular, the oxytocin antagonists of this invention are useful in the prevention of preterm

labor and premature birth which is a significant cause of infant health problems and infant mortality.
